

I am aware that the effect of these lights maybe worse for the population over 50, but given the size of this portion of the diving population, this problem must be taken seriously. I have friends that are so effected by this glare that they have a habit of always flashing their high beams at approaching HID vehicles. Some have considered using a strobe flash to punish these HID users as they approach. The problem could lead to white hair road rage and the resulting safety problems. Would some type of filtered diving glasses help the problem?
